

DATA ANALYSIS REPORT – DIGITAL WORD OF MOUTH

1.INTRODUCTION

In today's digital world, consumer decisions are no longer made in isolation. People actively rely on online reviews, ratings, and peer recommendations before making any purchase. This shift has made digital word of mouth one of the most powerful factors influencing consumer behaviour.

This analysis is based on survey data collected from respondents to understand how online reviews, brand interactions, and customer experiences impact purchasing decisions. The goal is to extract meaningful insights that can help businesses better understand their customers and improve their digital presence.

2.OBJECTIVES OF THE ANALYSIS

- To understand how frequently consumers engage in online shopping
- To analyze the role of online reviews in decision-making
- To examine how trust is built through digital-making.
- To identify factors that motivate customers to share reviews.
- To evaluate how quickly online reviews influence purchase decisions.

3. DATA ANALYSIS & INSIGHTS

Before diving into individual visualizations, it is important to understand that the following analysis is based on survey responses collected from participants. The data has been visually represented using different charts to make patterns, trends, and insights more clear and easy to interpret.

Each graph highlights a specific aspect of consumer behaviour related to digital word of mouth, including trust, decision-making, and engagement with online reviews. The insights derived from these visualizations help in understanding how modern consumers interact with digital platforms before making purchase decisions.

3.1. Age Distribution of Respondents

Interpretation: The age distribution of respondents shows that the majority of participants fall within the **21-30 age group**, making it the most dominant segment in the dataset. On the other hand, respondents aged **above 40** represent the smallest group.

This indicates that the survey is largely driven by younger individuals, who are typically more active on digital platforms and more influenced by online reviews. As a result, the insights derived from this data are more reflective of the behaviour and preferences of the younger demographic.

3.2. Gender Distribution of Respondents

Interpretation: The gender distribution reveals **that female respondents are higher in number compared to male respondents** in this survey.

This suggests that dataset has a slightly higher representation of female perspectives, which may influence the overall insights. It also highlights that female consumers are

actively engaging in sharing opinions and participating in surveys related to online shopping and reviews.

3.3. Online Shopping Frequency of Respondents

Interpretation: The analysis of shopping frequency shows that the majority of respondents shop **occasionally (once a month)**, making it the most common behaviour. This is followed by users who shop **frequently (2-3 times a month)**. A smaller group shops **rarely**, while very few respondents fall into the categories of **very frequent shoppers (once a week or more)** or those who **never shop online**.

This indicates that while online shopping is widely adopted, most consumers prefer a **moderate purchasing pattern rather than a very frequent transactions**. It suggests that online shopping is a regular part of consumers' lives, but it is typically need-based rather than impulsive or excessively frequent.

3.4. Awareness of Digital Word of Mouth Marketing

Awareness of Digital Word of Mouth Marketing

Interpretation: The data shows that a significant majority of respondents, approximately **67.6%**, are aware of digital word of mouth marketing, while **32.4%** of respondents are not aware of it.

This indicates that although awareness is relatively high among consumers, there is still a considerable portion of users who are unfamiliar with the concept. It highlights an opportunity for businesses to further educate and engage customers about the importance and impact of online reviews and recommendations.

3.5. Most Trusted Platform for Online Reviews

Interpretation: The analysis shows that **brand pages with customer feedback** are the most trusted platform among respondents, with the highest number of responses (**41**). This is followed by **video reviews and product demonstrations** (around **32**), indicating that visual content also plays a significant role in building trust.

On the other hand, **social media posts** (around **17**) and **reviews on e-commerce websites** (around **15**) are comparatively less trusted by users.

This suggests that consumers prefer **direct and detailed sources of information**, such as official brand pages and in-depth video reviews, over general or less structured content. It highlights the importance for brands to maintain transparent and interactive feedback sections on their platforms.

3.6. Frequency of Searching Online Reviews

Interpretation: The data reveals that a majority of respondents **always search for online reviews** before making a purchase, with the highest response count (**42**). This is followed by users who **sometimes (29)** and **often (28)** check reviews. Only a small number of respondents (**6**) reported that they **never** search for reviews.

This clearly indicates that searching for online reviews has become a **standard step in the customer decision-making process**. Most users actively seek feedback and opinions before making purchases, highlighting the strong influence of digital word of mouth in reducing uncertainty and guiding choices.

3.7. Usage of Online Forums Before Purchase

Interpretation: The analysis shows that the majority of respondents **sometimes use online forums** such as Reddit or Quora before making a purchase, with the highest response count (**45**). This is followed by users who **rarely (around 22)** and **always (around 21)** refer to forums. A smaller group (**around 15**) reported that they **never** use forums for this purpose.

This indicates that while online forums are not the primary source for every consumer, they still play a **supporting role in the decision-making process**. Users tend to consult forums occasionally when they need more detailed, unbiased, or community-driven opinions beyond standard reviews.

3.8. Key Factors Influence Customer Trust in Online Reviews

Key Factors Influencing Customer Trust in Online Reviews

Interpretation: The combined analysis of multiple factors clearly highlights that **digital word of mouth plays a crucial role in building customer trust.**

A large majority of respondents believe that digital word of mouth significantly contributed to trust and credibility, with only a small portion expressing otherwise. This shows that online reviews, recommendations, and discussions have become a reliable source of information for consumers.

When it comes to reducing purchase risk, most respondents **agree that online reviews help them make safer and more confident decisions.** A noticeable number of users remain neutral, while fewer respondents disagree, indicating that reviews are generally perceived as helpful in minimizing uncertainty.

Similarly, the analysis of online ratings shows that the majority of respondents either **agree or strongly agree** that higher ratings and positive reviews increase their trust in a brand. Only a small segment expresses disagreement, suggesting that ratings play a strong role in shaping brand perception.

Additionally, the data reveals that **quick and effective responses from brands to customer reviews or complaints significantly enhance trust levels.** Most users feel more confident in brands that actively engage with their customers, while only a small percentage does not consider it important.

Overall, these findings clearly indicates that trust is not built by a single factor but through a combination of **reviews, ratings, and brand responsiveness**. Businesses that actively manage these aspects are more likely to build stronger relationships with their customers and influence their purchase decisions.

3.9. Factors Motivating Customers to Share Product Reviews

Interpretation: The analysis shows that the most common reason for customers to share product reviews is their **desire to help other customers**, which has the highest response among all factors. This is followed by **extremely positive or negative product experiences**, indicating that strong emotions also drive users to express their opinions.

In comparison, **rewards or discounts** play a lesser role in motivating users, while **other factors** have minimal influence.

This suggests that reviews-sharing behaviour is largely driven by **genuine intent and personal experiences rather than external incentives**. Customers are more likely to contribute when they feel their feedback can guide others or when they have had a particularly strong experience.

3.10. Impact Speed of Online Reviews on Purchase Decisions

Interpretation: The data indicates that a majority of respondents are influenced by online reviews **after some level of consideration (48.6%)**, making it the most common behaviour. This is followed by users who are **rarely influenced (27.6%)**, while a smaller group is influenced **immediately (15.2%)**. Only a very small percentage (**8.6%**) report that they never influenced by online reviews.

This shows that while online reviews have a strong impact on consumer decisions, most users do not act impulsively. Instead, they take time to evaluate the information before making a final decision. It highlights that reviews act as a **guiding factor rather than the sole deciding factor** in most purchase journeys.

4.OVERALL INSIGHTS

The overall analysis highlights that digital word of mouth plays a significant role in influencing consumer behaviour. Most users actively rely on online reviews to make informed decisions, reduce purchase risk, and build trust in brands.

Additionally, factors such as brand responsiveness, customer experiences, and authentic feedback contribute strongly to trust-building. Consumers are also motivated to share reviews primarily to help others, reflecting a community-driven behaviour in the digital space.

While online reviews influence decisions, most users take time to evaluate information rather than making immediate choices, indicating a balanced and thoughtful decision-making process.

5.CONCLUSION

In conclusion, digital word of mouth has become a powerful tool in shaping modern consumer decisions. Businesses that actively manage their online presence, encourage authentic customer feedback, and respond effectively to reviews are more likely to build trust and long-term customer relationships.

Understanding consumer behaviour through such data analysis enables brands to make better strategic decisions and enhance their overall customer experience.
